Mathematical Logic In Chapter 4 we gave a set-theoretic construction of the set  $w$  of natural numbers. In the present chapter we will continue to show how mathematics can be embedded in set theory, by giving a set-theoretic construction of the real numbers. (The operative phrase is "can be," not "is" or "must be."

Enderton Set Theory Solutions I definitely recommend this book to anyone that would like to self-study Set Theory. This is a quite good book introducing Set Theory. It's a bit more than "Naive Set Theory" by Paul R. Halmos, while not so deep as discussing proofs and forcing. I was reading "Set Theory" by Thomas Jech at the beginning, and found that it's too difficult for me.
